

Your Solution to Empty Pallet Storage Problems

Loading docks cluttered with loose pallets and cartons are a common problem for many facilities. It's not just an aesthetic problem; it's one of safety and operational efficiency.

Two decades ago, Steel King recognized the problem and pioneered the solution: Over-Dock Pallet Storage Racks.

Steel King's standard SK2000 or SK3000 can be designed and configured to fit around your loading dock doors – letting you take advantage of otherwise wasted space.

Take advantage of the space around your loading doors with

Over-Dock Pallet Storage Racks

Great for storing:

- *Empty pallets*
- *Empty cartons*
- *Packing materials*

Use your loading area efficiently

Steel King has designed two unique over-dock racking products to help you efficiently use space and reduce the chance of lift-truck impact. Two designs are offered – a single-leg, wall-tied system and a ceiling-supported system with no lower legs.

Single-Leg, Wall-Tied

The single-leg, wall-tied design features an upright frame with a special offset leg and a single, back column support up to a height that will clear the door. Single-leg, wall-tied systems are best suited for buildings with poured concrete walls or exposed-column buildings. The heavy-duty wall ties used to stabilize the frame vary in length; beam lengths also vary to clear the door. Single-leg, wall-tied racking systems should be used primarily for empty pallets or light loads.

One advantage of this system is that the front post, where most potential damage occurs, is removed. The single-leg, wall-tied design is anchored to the floor with four bolts. The rack system needs to be secured with heavy-duty wall ties. Each wall tie is bolted to the rack column and anchored to the concrete wall or exposed building column.

Rack Construction

- Structural channel load beams with bolted connections
- Two bolt-in pallet supports under each pallet position
- Safety netting or bolt-in steel retaining straps used at the back of each rack bay to positively retain pallets

Optional Accessories

- Post protection with the Steel Guard system (recommended for single leg racks)
- Column Core adds five times the strength to columns
- Guard Dawg safety rail system

Your local Steel King representative, along with our engineering department, would be pleased to develop a design specifically for your facility.
