

Collision Sentry® Always on Guard

“Creating a safer working environment in industrial buildings where forklift traffic and pedestrian traffic intersect.”

Why Collision Sentry?

Blind spots around corners where pedestrians and forklifts intersect are a major cause of accidents. Pedestrians and employees hit by forklifts account for 20% of forklift accidents or about 19,000 people per year.

Every day in thousands of industrial environments, pedestrians and forklifts maneuver through buildings covering the same territory and often crossing the same path. When those paths cross at a “blind corner” intersection, the result is damaging – not only to the equipment and facility – but more importantly – to people.

Always on guard, 24/7, Collision Sentry stands watch over “blind corner” intersections in industrial settings where pedestrian traffic and forklift traffic converge. When motion is detected on both sides of the corner, Collision Sentry works like a traffic light to send a visual signal to warn approaching traffic of a possible collision.

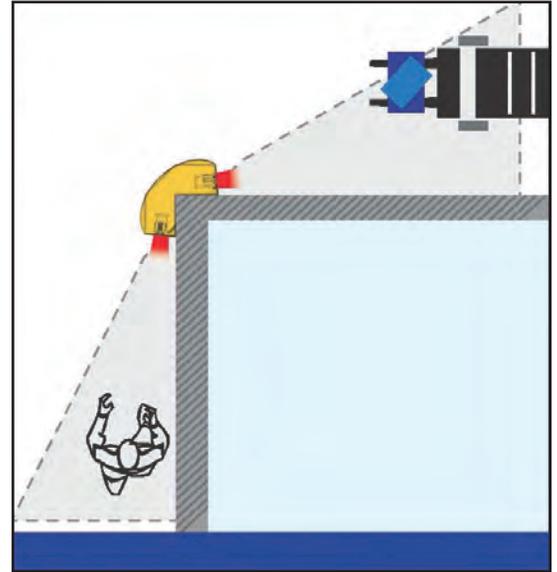

“If there is a blind corner where it is impossible to see traffic, Collision Sentry will see for you.”

*Jim Ryan, President
Sentry Protection Products*

The Collision Sentry Advantage

- Each unit is **self-powered** using standard D-cell alkaline batteries, eliminating the need for any wiring to a facility's electrical system. Batteries are designed to operate for one to two years before battery change depending on usage. The system is equipped with a low-battery indicator that sends warning well in advance of the batteries needing replacement. When needed, replacements are readily available.
- **Passive Infrared Motion Sensors** are programmed to detect motion on both sides of the corner, sending a warning in ample time for the forklift driver and the pedestrian to correct their movements. These PIR sensors are a proven technology often used in security lighting and alarm systems. They are rugged, feature a wide lens range and don't wear out.
- **Highly visible LED lights** on the Collision Sentry warn of a possible collision by flashing when motion is detected from both directions. LED lights are known for their relatively long life, requiring minimal or no replacement and resulting in reduced maintenance costs. Collision Sentry's warning lights flash only when someone is really there, creating less false reads and sending a powerful visual warning of a possible collision. Collision Sentry's PIR sensors are pre-set and ready to use. No adjustment time necessary.
- Collision Sentry is **portable**, requires minimal space and no tools for installation. Installs easily and virtually anywhere. The unit is **compact, lightweight** and can be **deployed immediately** following installation. With the included magnet mounts, units can be easily snapped onto pallet racking systems. A tether is included with each unit for added fastening security.

Collision Sentry® – Always on Guard

Sentry Protection Products is a leading provider of innovative, impact resistant products for industrial applications. Manufactured in the United States and Europe and sold worldwide, the award winning, patented product line includes Column Sentry®, Rack Sentry®, Concrete Wrap™, Park Sentry®, Corner Sentry™ and Collision Sentry®. Sentry is headquartered in Lakewood, OH. For additional information call 1.888.265.8660, email info@sentrypro.com, visit www.sentrypro.com or follow Sentry's Twitter feed [@SentryProtect](https://twitter.com/SentryProtect).
