KEEP YOUR EMPLOYEES
SAFE

ALERT Safety Products: Line ALERT

Our line of industrial safety line projectors come in LED and Laser technology and are designed for use in industrial environments where safety is a primary concern. They are used to create highly visible lines that can help workers and operators identify hazards and avoid accidents in hazardous or low-light conditions.

Line Alert

Industrial safety line projectors typically have bright and high-contrast lines that can be projected onto floors, walls, or other surfaces. The lines can be used to indicate areas that are off-limits or hazardous, mark out safe pedestrian walkways or vehicle routes, or identify the location of emergency equipment or exits.

We also offer complete systems that have built-in motion sensors, which automatically turn on/off the laser or LED projection when a person or object enters/exits the projection area.

Several applications include:

- Warning at Pedestrian Walkways
- Warning in Crane Bays
- Warning around Machinery
- Warning at Workstations close to forklift aisles

It is important to choose an industrial safety line projector that is appropriate for the intended application. We can custom design other types of projected images and virtual walkways as needed.
