

Red or Green Beam Laser...which is best for you?

Red Beam Lasers have been a mainstay in the industry for a while, but in recent years technology has improved and Green Beam Lasers have become available. But which color laser is best for you?

Green Beam Lasers operate at a different light frequency to red, and thus appear brighter to the human eye in natural sunlight even though they produce the same output for a Class 3R Laser.

Our Green Beam Class 3R Laser operates at 520nm@5mW output.

Our Red Beam Class 3R Laser operates at 635nm@5mW output.

Your application and preferences will be the deciding factor in which laser color will be best for you.
